Problem Description

Corona virus, which first came to Turkey on March 10, 2020, seriously damaged major sectors in the country. These are: health, economy, employment, tourism etc. However, on the basis of all of them, the damage to the economy both to the world and to our country has actually been the main reason for other sectors to be interrupted. For example, the economic downturn has caused many companies to fire their employees, take unpaid leaves or make various cuts.

The biggest repercussions of the economic problems were felt by smaller investors who trying to run their own business. Among these: cafe, restaurant, pub, game room owners can be considered. The main reason why the smaller businesses of the type I mentioned are so affected is that the customer must be physically present and the expenditure must be direct. However, the fact that such places had to be closed in line with the measures taken during the pandemic process affected them much more negatively in terms of business.

First Graph

- The first graph is obviously shows that the virus affects the companies negatively. Especially the last months of the year, the closing copmanies rates is increasing.

Second Graph

- This graph shows that the established companies rate is really high than company closing rate but one of the difficulties I had while doing my project is that I was not sure about the datas are reliable or not.

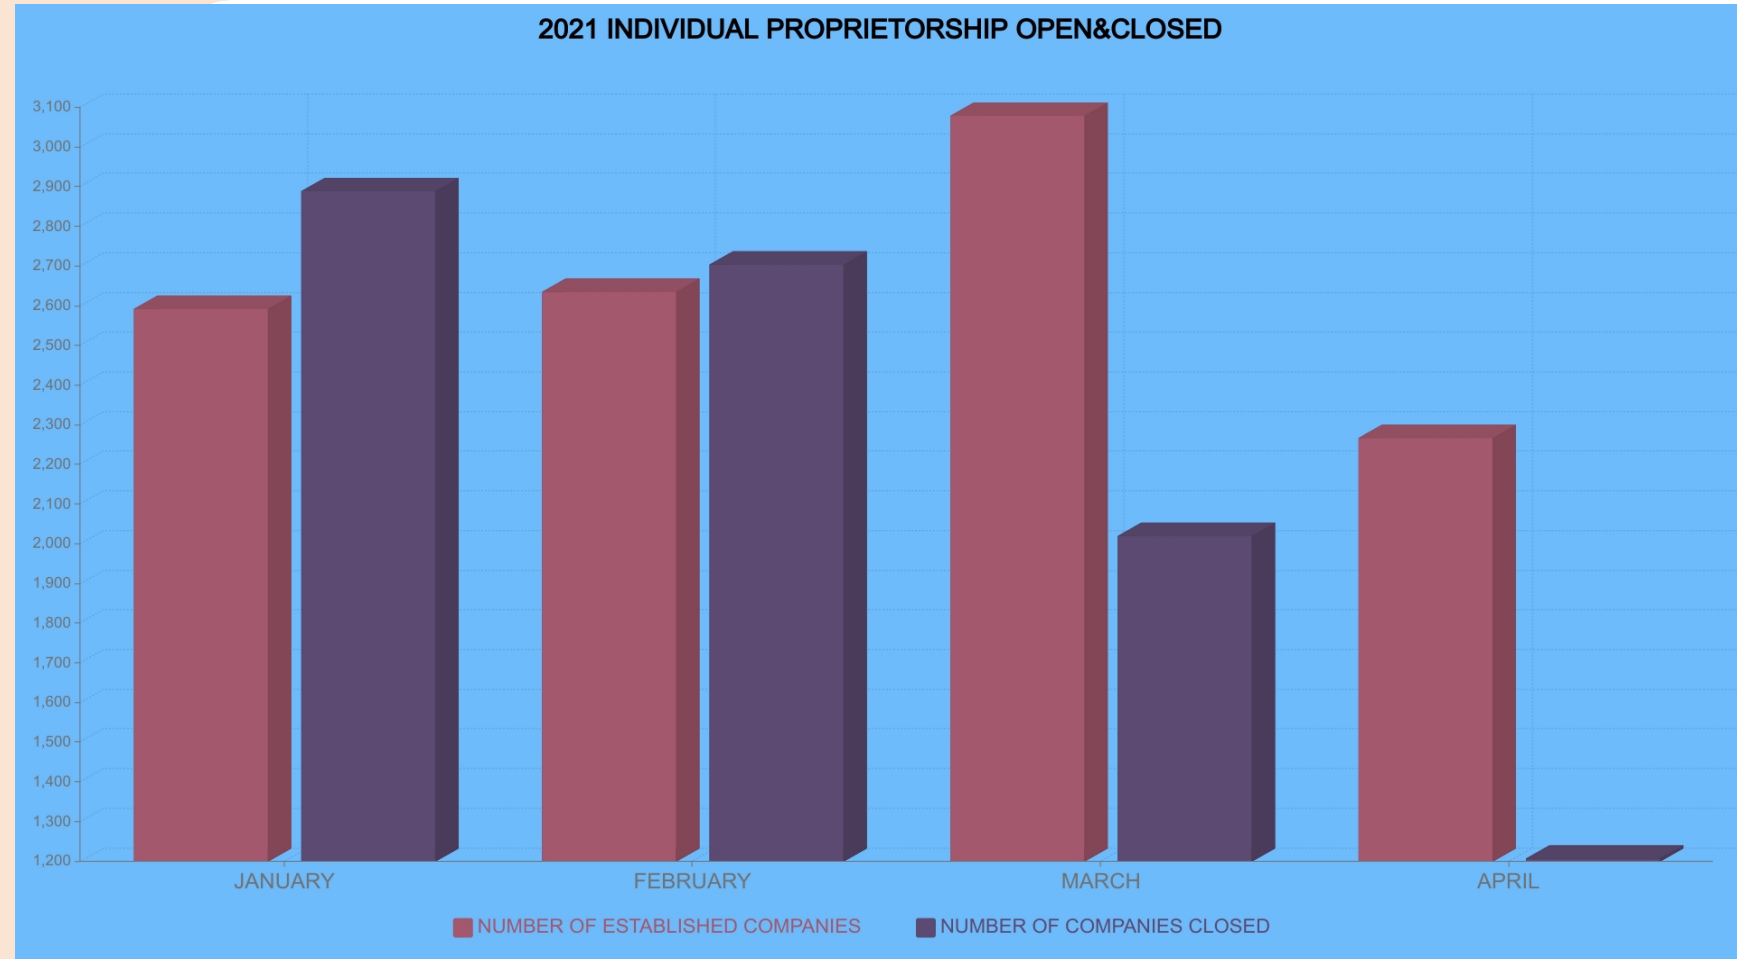

Third Graph

- The difference of that graph show the individual proprietorship open & close rate. Actually, it was the main problem in my project. As you can see the small business owners had really hard problems with the economic effects of the virus. In December, the closing individual proprietorship rate is almost 1,5 times than the opening companies rate.

Fourth Graph

- This graph shows the 2021's rate and as you can see the first period of the year, closing individual proprietorship rate is higher than the established proprietorship companies rate. We can understand that, this year started in a better position than the last year but the problem is still dangerous.

Fifth Graph

- The last graph of my project is about Unemployment Rate. As you can see in 2020 the rate is in the top three among other countries. And it still really high. We can understand that the unemployment problem will continue to affect people negatively.

The Result of the Study

- As a result of my research, I saw that Turkey is not the only country economically affected by the pandemic process. In other words, almost every country has been affected by a certain amount of pandemic. However, I found data showing that the problem in our country is more serious than in many other countries.
- The virus has caused serious damage to the country's economy in commercial, political, health and many areas. In addition to this information, the most accurate way to conduct a worldwide economic study was to look at unemployment rates. I examined the effects of the virus on employment, as well as the effects on the public, based on the dates of its entry into the country, with unemployment rates.
